

Who am I?

Name = Ratchapol

Surname = Channiti

Nickname = Tawan

Age=17

Character= kind, friendly and clever

Hobbies= retro computing, modifying computers, building computers.

My academic and professional background

International school from kindergarten to high school

Last school: Niva International School

Currently doing: GED

My accomplishment

Operating system = (Project name:TDIS(Tawans_Desktop_Interface_Software)) (Prototype name:TDIS|ALPHA)

Game server = (Project name:Tcorp minecraft server)

Custom gpu server (entry level) = (Project name:TCGS(Tawans_Custom_Gpu_Server) SYSTEM) (Prototype name:TCGS-PM1E)

What am I interested in?

Mostly my main interest is on computer hardware and a bit of computer software but in my opinion they both have to be combined, for example if I would have a computer that has no software in it or maybe even no firmware in the bios chip it renders the computer useless so this is why software exist and its also a reason why I'm interested in computer software at the same time as computer hardware.

My life goals

For my life goals for now it's to have a job at IBM but who knows what the future says maybe there might be an even better job which I might enjoy doing. Since many people choose jobs base on their income or salary they get, but for me I always want to choose a job that I is suitable for me and a job that I usually happy with on a daily basis so that I can have good and long term job or business that will both benefit myself and family.

Why did I choose this faculty and university, what is my goal here?

As a computer hobbyist and technician for a while I think it's time to pursue something bigger and deeper about computers as I always think the world of computers is considered an ongoing piece of technology which improves and moves on as time moves by and at a very quick pace.

Furthermore I have chosen KMITL because the university is home to one of the best Computer Engineering faculties in Thailand hoping that it is capable of helping me in my passion and motivation in diving deeper into the computer world.

What motivated me.

When I got my first computer which is a laptop and I wondered how does it work, what's in the inside and its components how do they function? At that time the question

was stuck to my head and motivated me into the world of computers and after sometime I got my hands on this old desktop computer which I decided to take it apart and self-taught myself the basics of building a computer and learned from my mistakes which costed me 3 computers but that didn't make me give up but instead passionate into computers and after 4-5 years of experience I became a computer hobbyist and technician and at this point I was building and maintaining and also repairing a lot of different computer types ranging from desktops, servers, laptops, specialized computer hardware and IoTs.
